

■ Seaborn Cheat Sheet

1. sns.scatterplot()

Creates a scatter plot. Use `hue`, `style`, or `size` to add visual distinctions.

```
import seaborn as sns import matplotlib.pyplot as plt tips = sns.load_dataset("tips")
sns.scatterplot(x="total_bill", y="tip", data=tips, hue="day", style="time") plt.show()
```

2. sns.histplot()

Creates a histogram of univariate or bivariate distributions. Use `kde=True` for smooth curves.

```
sns.histplot(data=tips, x="total_bill", bins=20, kde=True) plt.show()
```

3. sns.boxplot()

Displays the distribution of a variable across categories with quartiles and outliers.

```
sns.boxplot(x="day", y="total_bill", data=tips, hue="sex") plt.show()
```

4. sns.heatmap()

Visualizes matrices with colored cells. Useful for correlation plots and grids.

```
import numpy as np matrix = np.random.rand(5, 5) sns.heatmap(matrix, annot=True,
cmap="coolwarm") plt.show()
```

5. sns.pairplot()

Plots pairwise relationships across an entire DataFrame with optional `hue` grouping.

```
iris = sns.load_dataset("iris") sns.pairplot(iris, hue="species", palette="bright")
plt.show()
```
